Digital Literacy Project Report

Name:	Anakha Shaji
Reg No.:	[Please provide Registration Number]
Branch:	Integrated M.Tech (AI & Bioinformatics)
Year:	1
Course Code:	[Please provide Course Code]
Date:	March 27, 2026

Introduction

This report documents the work completed for the Digital Literacy project, a foundational component of the first-year curriculum. The project was designed to build essential skills for navigating the modern digital landscape, which is particularly critical for students in technical fields like AI and Bioinformatics. The scenario involved completing a series of five distinct tasks, each targeting a core area of digital competence: visual communication, professional online presence, coding and collaboration, digital etiquette, and cybersecurity awareness. This structured approach provided a comprehensive overview of responsible and effective digital practices. The following sections detail the process, outcomes, and reflections for each task, culminating in a summary of the overall learning experience and its implications for future academic and professional endeavors.

Task 1: Digital Literacy Infographic

The first task required the creation of a single-page infographic to visually summarize the key tenets of digital literacy. I utilized Canva for this purpose, leveraging its user-friendly interface and extensive library of design elements. The infographic defined digital literacy as the ability to effectively find, evaluate, and communicate information using digital technologies. Key topics covered included safe internet practices, such as using strong passwords and enabling two-factor authentication, and professional email etiquette, emphasizing clear subject lines and formal greetings. A significant challenge was to achieve high information density without creating a cluttered or overwhelming design. I addressed this by using a structured layout with clear headings, relevant icons to represent concepts visually, and a consistent color scheme to guide the viewer's eye. The process of distilling complex information into a concise visual format was a valuable exercise in communication. This task not only solidified my understanding of digital literacy principles but also enhanced my skills in using design tools like Canva to present information in an accessible and engaging manner.

Task 2: Student Digital Portfolio

This task focused on establishing a professional online presence by creating and curating profiles on key platforms: GitHub, LinkedIn, and Kaggle. The purpose was to understand that these platforms are not static profiles but dynamic portfolios that showcase technical skills, academic progress, and professional aspirations. For GitHub, I created a profile with a detailed README file outlining my academic interests in AI and Bioinformatics and my programming skills. On LinkedIn, I meticulously updated my education and skills sections to align with my career goals and connect with peers and industry professionals. I also set up a Kaggle profile to engage with the data science community, which is directly relevant to my specialization. My future plan for these platforms involves regular maintenance; I will consistently push new coding projects to GitHub, update my LinkedIn profile with new skills and accomplishments, and participate in Kaggle discussions or competitions to build a practical skill set. This task was a crucial lesson in personal branding and the strategic use of social platforms for professional development.

Task 3: Coding & Collaboration Platforms

Task 3 involved hands-on practice with platforms for coding and data collection. I used HackerRank to sharpen my problem-solving skills by completing a beginner-level coding challenge. The challenge required logical thinking and a foundational understanding of data structures, providing practical experience in applying programming concepts. For the collaboration component, I created a "Digital Literacy Awareness Quiz" using Google Forms. I designed five multiple-choice questions covering topics like phishing, password security, and email etiquette. The data collection process was seamless; I shared the form's link and was able to monitor responses in real-time. Using the integrated Google Sheets feature, I analyzed the responses to identify common areas of misunderstanding among respondents. This exercise demonstrated the power of cloud-based tools for both individual skill development and collaborative data gathering. The ability to quickly build a data collection instrument and analyze the results is a skill that will be invaluable for future academic research and team projects.

Task 4: Professional Email & Social Media Etiquette

This task centered on the practical application of professional communication standards. I drafted two emails for common scenarios: one requesting a necessary assignment extension and another applying for a competitive internship. The extension request was framed politely, clearly stating the reason and proposing a new submission date to show responsibility. The internship application was tailored to the role, highlighting relevant skills and expressing genuine interest. This exercise reinforced the importance of clarity, tone, and structure in professional correspondence. Additionally, I created a "Social Media Do’s and Don’ts" checklist to serve as a personal guideline. It emphasized thinking before posting, maintaining a professional public image, and protecting personal information. The key learning from this task was that every digital communication, whether an email or a social media post, contributes to one's professional reputation and requires careful consideration.

Task 5: Cybercrime Awareness

The final task was a case study on phishing, a prevalent form of cybercrime. I researched how phishing attacks are executed, noting that attackers often use deceptive emails or websites to trick individuals into revealing sensitive data. The consequences for students can be severe, including financial loss, compromised academic accounts, and identity theft. To translate this awareness into action, I developed a prevention checklist with actionable tips like verifying link destinations before clicking, using unique passwords, and enabling two-factor authentication. A key habit I will change is to be more skeptical of unsolicited communications and to actively use the reporting mechanisms available, such as the National Cyber Crime Portal (helpline 1930). This task was a stark reminder of the real-world threats present online and instilled a greater sense of personal responsibility for digital security.

Conclusion

This Digital Literacy project provided a comprehensive and practical education in essential modern skills. By progressing through tasks focused on design, professional branding, coding, communication, and security, I have developed a holistic understanding of how to operate effectively and safely in a digital world. The project has moved my knowledge from theoretical to applied, building my confidence in using a variety of digital tools. The skills acquired—from creating a professional GitHub profile to recognizing a phishing attempt—are directly applicable

to my studies in AI and Bioinformatics and form a critical foundation for my future career in technology.
